

# Executive Summary

## New York NLC

### Exploratory Data Analysis

---

#### Overview

Our data team was tasked to perform exploratory data analysis as a part of New York NLC machine learning project we're working on. This summary shows the results of the process and the advancement in the project.

#### Objective

The goal of this stage of the project is to:

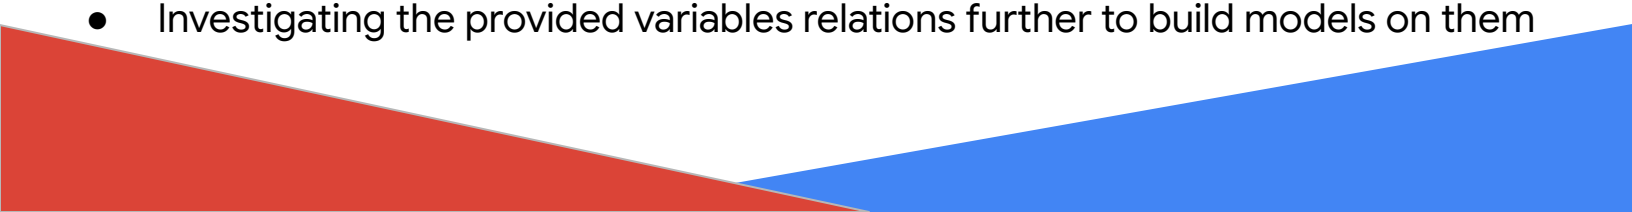

- Make sure the data is cleaned with no missing values and in appropriate format.
  - Conduct some visualization that help identify paternity, trends and relation between variables
- 

#### Results

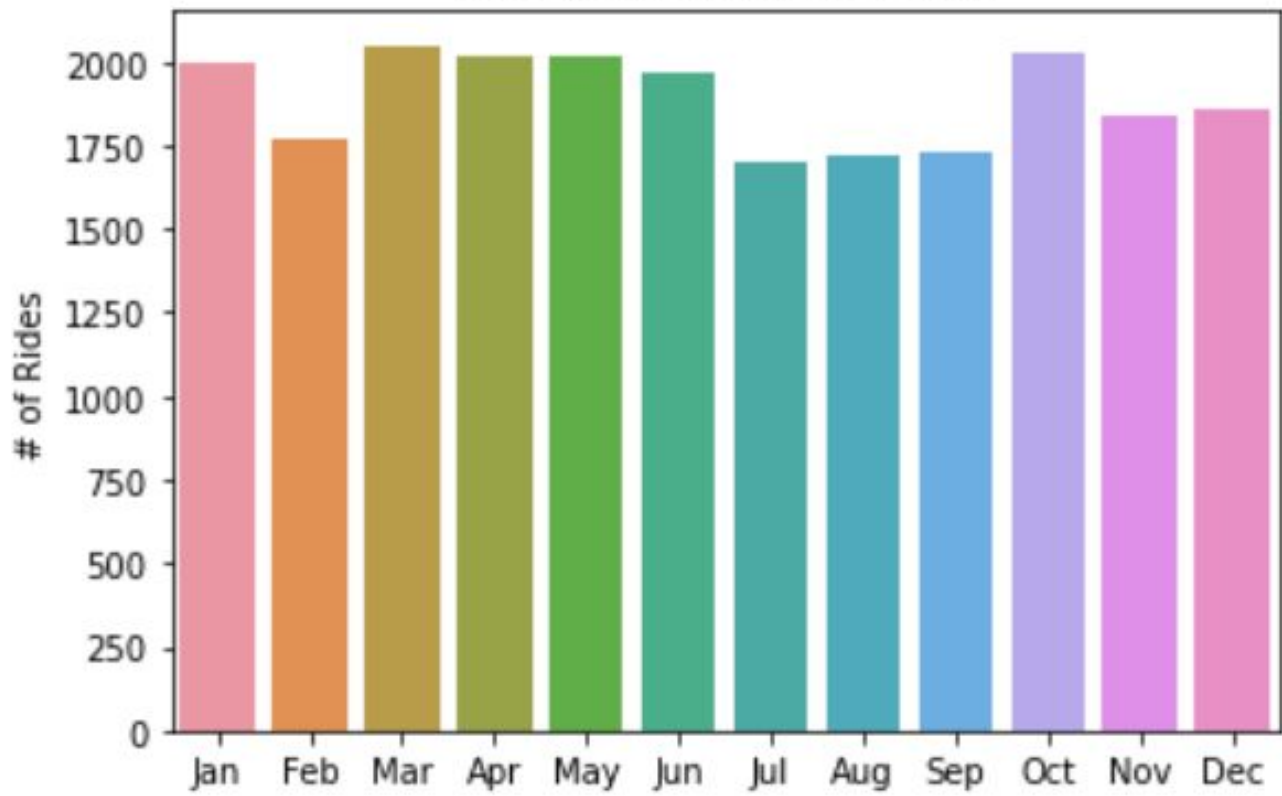

Some of important insights worth sharing are:

- There is a weak direct relation between trip distance and total amount. However, There is a very strong relation between drop off location and trip distance.
  - There is no missing data but There are many outliers.
  - Vendor 2 has much more tips compared to vendor 1. And passengers count don't strongly affect tip amount.
  - Some days and month have more rides on average compared to others as shown in figures.
  - Thursday achieved the highest total revenue. Same for May in months.
- 

#### Next Steps

- Outliers can be dealt with by replacing them by average values.
  - Statistical measurement need to be done on the dataset.
  - Investigating the provided variables relations further to build models on them
- 

Number of Rides Per Month

Number of Rides Per Day
